It might be legit since you'd do that if there really WAS a spike.
But I think it's cause & effect because anyone in right mind would be happy that % infected is rising without much illness or deaths.
If we could have got away with this in March, we'd have taken it.

Since the number of positives have nothing to do with the infectious state of those swabbed, it's clearly going to go wherever it's authors want it to go.

IF another lockdown looms, we must all peacefully demonstrate in our hundreds of thousands in a socially distanced manner.

> **Robert Peston** @Peston
> Tougher social distancing measures loom in just two weeks if Rule of Six does not change our behaviour and if rate of virus spread does not flatten, I understand itv.com/news/2020-09-1...

7 64 142

Hunt on BBCR4 asserting "that only when everyone in the country can be tested for SARS-COV-2 several times a week can we get back to anything approaching normality".
Wrong. Cease mass testing with an assay of unknown false positive rate. If FPR is 2%, 99% of 'cases' are false.

86 312 801

Matthew Evans @mjamesevans · 2h

How does this change unless the population stop getting tested of their on backs the government will continue with operation moonshine. @Jeremy_Hunt needs to understand that the testing is not accurate enough to provide suitable data now let alone millions of tests per day.

Healthcare data are available for **nations** and **NHS regions**.

Daily count of confirmed COVID-19 patients in hospital at midnight the preceding night. Data from the four nations may not be directly comparable as data about COVID-19 patients in hospitals are collected differently. Data are not reported by each nation every day. The UK figure is the sum of the four nations' figures and can only be calculated when all nations' data are available.

Daily Data About

1

Anshul @Anshul__K · 3h

The issue with hospital admissions is you don't know how many are actually being treated for covid.

2 1

Yardley Yeadon

Replying to @Anshul__K @safxtypingirl and 2 others

Quite. I don't even trust admissions data, because I've already come across scams that results in "admission while infected by covid19" not meaning what most people expect from that status.

Hunt on BBCR4 asserting "that only when everyone in the country can be tested for SARS-COV-2 several times a week can we get back to anything approaching normality".
Wrong. Cease mass testing with an assay of unknown false positive rate. If FPR is 2%, 99% of 'cases' are false.

87 314 803

Anshul @Anshul__K · 5h

Only country in Europe wanting to test everyone weekly. We are testing almost twice as much (per thousand) than Germany and they have fans in stadiums now. What is going on?

19 32 195

Matistuta @Matistuta1 · 5h

Tory power grabbing. Last time they get a chance for a while too as they wont get voted back in any time soon.

It's not designed to work. If it was then, SK-style, they'd follow up those who are asked to self isolate.

They don't it's estimated that close to 80% of the supposed self isolaters do no such thing.

So you see, it's all our fault. Beatings will continue until morale improves.

Imo it's not necessary, period.
We made a huge deal of this because we first thought lethality was 30-40x flu.
As we learn more, lethality estimate plummeted.
I expect it'll end up as lethal as typical seasonal flu.

It might be legit since you'd do that if there really WAS a spike.
But I think it's cause & effect because anyone in right mind would be happy that % infected is rising without much illness or deaths.
If we could have got away with this in March, we'd have taken it.

1 3 23

Lesley Johnson @LesleyLelly88 · 1h

My thoughts too RCT had one of highest death rates in Wales, once it goes through the population again surely we'd be at herd immunity?

I don't think that's fair.
Imagine a scenario where they have a bad cold or flu.
You'll get the results described. Few to no subjects have the novel virus.
Almost EVERY respiratory tract infection has symptoms overlapping those of covid19.
This issue will be 10x worse in 2mo.

I don't think it's reasonable to compare 'cases' between countries. I'm not sure the definitions are sufficiently crisp. Different rules or guidance for when to be tested. Lack of or plenty of tests is likely to be a major factor in difference.
Serious answer; huge pop immunity.

The whole thing is nonsensical. For a supposedly new virus, how does testing make any difference, from a design point of view, the testing kits are mere prototypes.

Moree Spinne @MoreeSpinne · 20h
Prof Carl has been very vocal of the misuse of PCR test. Yes it's possible that this test is entirely unfit for purpose. But this is what we have. Might as well focus on applying it better with CT of 30 instead of 40+.

1 4

Howard Steen @HowardSteen4 · 20h
The fundamental problem is that an active infection in a person can only be evidenced by symptoms because 'infection' is a reaction of the body which PCR cannot 'see'. It only detects fragments of molecules so unsuitable for diagnostics. Better suited for forensics.

1 2

Howard Steen @HowardSteen4 · 20h
Also there is an ethical and moral dimension to the decision of using a measuring tool which does not directly measure what you really want to know. There is 100% certainty of infection present when done clinically & based on symptoms but can never be 100% with PCR.

2 3

Yardley Yeadon

If it's simply number of positive tests then that misleading.
Also we can estimate that the number of new infections per day was around 150,000 in UK in mid March. A percent or two of that peak only. And likely quite a chunk are false positives.

coronavirus.data.gov.uk
4

Robert Hudson @RobertH27576599 · Sep 15
I would suggest that you drill down on that graph. You will find it has already started to go down. 'Cases' are a nonsense indicator anyway - 'rubbish' test, false pos, too sensitive and test more find more. If gov decided not to test then there would be no 'cases'.
2 3

bad takes bot @badtakesbot1 · Sep 15
There are almost no false positives. The @ONS has confirmed that the specificity is >99.96%. Tests are almost never that good.

The numbers appear to be plateauing, but we know there are growing shortages of tests and lab delays, so it's too early to judge.
6

Yardley Yeadon
@MichaelYeadon3

Wrong.
The ONS methodology is NOT the same as that used in Pillar 2 mass testing. The latter has reported an average of 2% positive everywhere and all the time since June.
Can you think of a reason?
During that time, hospitalisation & deaths have matched steadily downward.

bad takes bot @badtakesbot1 · Sep 15
They can't measure the true specificity because we're in the middle of a pandemic. That's explained in the paragraph I posted.

1

Neil D @NeilTheDevGuy · Sep 15
The problem is actually because we're NOT in the middle of a pandemic. Therefore the prevalance is so low it's impossible to distinguish between the real and false-positives. The specificity needs to be worked out against actual gold-standard stuff, like viral culture cultivation

1 5

bad takes bot @badtakesbot1 · Sep 15
The gold standard would be to test the test on large numbers of people who definitely didn't have Covid.

If you test the test with other tests, they have their own false positive/negative rates too.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @badtakesbot1 @NeilTheDevGuy and 4 others

True, but the easiest mass scale confirmation is to retest all positives.
I would use a different primer set. But just doing it again with the same assay would help.
I'm of the opinion that Pillar 2 positives have always mostly been false. That's why no one is ill.

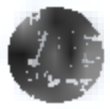
Hunt on BBCR4 asserting "that only when everyone in the country can be tested for SARS-COV-2 several times a week can we get back to anything approaching normality".
Wrong. Cease mass testing with an assay of unknown false positive rate. If FPR is 2%, 99% of 'cases' are false.

104 425 1.1K



Paul Simmons @Nevella1867 · 8h

Even if we assume the fpr is on the low side (e.g. 0.8%), somebody that took a test everyday could expect a positive test 3 times a year.

Frankly, that's just unacceptable.

1 1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Nevella1867

Absolutely. Prof Heneghan shows that a FPR of 0.1%, at current prevalence levels, means 50%+ positives are FALSE.

Ok: anyone think Pillar 2 screens, done on picnic tables in marquee tents by half trained staff using high tech cyclers & calling thresholds = FPR 0.1%?

I do not.

Has there been any update from the government regarding the updated testing methods to try and eliminate the false positive results?

Have they changed the test yet or still doing it the old way?

Clare Craig in Spectator. In Pillar 2, under 20s now hold 19% of positives. Close to theoretical 24% if evenly distributed. Just 2% of real illness was in <20s during pandemic.
I think this tells us not that the young have picked up the virus, but it's all false positive.

It was always implausible to me that youngsters were getting the virus. I think they're more likely to have had it & be immune. Also, lore says the vulnerable are impacted first. So I look at Pillar 2 & again see a wash of false positives.
Those who disagree, pls detail reasons.

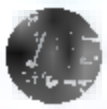
Out of 213 countries with Covid, China is 201st when it comes to cases per popn. - anyone have a good explanation for this anomaly?

279 233 836

Yardley Yeadon @MichaelYeadon3 · 2h

I don't think it's reasonable to compare 'cases' between countries. I'm not sure the definitions are sufficiently crisp. Different rules or guidance for when to be tested.
Lack of or plenty of tests is likely to be a major factor in difference.
Serious answer; huge pop immunity.



4 2 15

Chris Fryer @chrisf1874 · 2h

"Serious answer; huge pop immunity."
Still looking that way to me. Spain has outbreaks with increase in hospital admissions and deaths but that's been happening for two months now and looks nothing like an epidemic associated with low immunity.

What do you believe was different about Wuhan such that it appeared to suffer a very large outbreak not repeated in other major Chinese cities?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @MikeWil15978120 @carlheneghan

Being controversial, was it really very large? Pop of city 11 million. Deaths only 4,500. A little less than Sweden.
But it's a good point, large or small. Why did this not occur across China? Perhaps it did?

I'd like to answer that in two ways.
1. With transmission as it is now, pretty much so, I believe. Best not to expect HI to halt all infections.
2. IF TRANSMISSION speeds up in winter we'll fall below a HIT. More infections will top us back up. I think, anyway.

Hancock is misleading the House.
Importantly, it is wholly invalid to use the ONS surveillance data to indicate, roughly, what is the false positive rate for an entirely distinct activity, Pillar 2 testing.
ONS is fiercely independent, very careful & crucially, testing only..

Please give this serious consideration @MattHancock or @BorisJohnson

It's not difficult to understand the problem here. People do not want to suffer further hardships for no good reason.

Please publish the "false positive rate" and how you are ensuring the tests are accurate.

Thank you.
Julia: furthermore, it's not enough for the health sec to say "it's low, it's all fine, panic over".

No. We need to see the daily calibration data. That's where you run a known negative set of references, randomly inserted into the sequence of clinical tests.

In my view, it's not necessary to be performing so many tests. It's pretty much only U.K. that's running so many. Even we're "only" testing 0.3% of the population per day. Seen that way, restrict to patients & healthcare staff. That's what we did until June.

It would only take a "false positive" rate of about 1.8% for all current daily positive tests to be false.

Typically "false positives" for medical testing can be anywhere between 0.4% to 4%.

Therefore it is important for the government to disclose the rate.

"No test is better than a bad test".

It's difficult to find an assay which finds 1 in a 1000 (or less) who have the virus, but not wrongly also label 5, 10, 20x as many people as positives.

Irony, since FPR is an issue only when there's almost no virus around. Like now.

With tweaks, choice of primer sets, PCR is PCR. All kits are commercial. We'll be using much of the same consumables.

Ireland's health minister stated 1-3% false positives.

Mr Hancock, let's hear from you on FPR. Heads up: if you waffle about ONS, audience'll know you're lying.

Denis @carvillshill

Replying to @motogpbsb @Steve66546173 and 4 others

Our public health doctor @CillianDeGascun cited a false positive rate of 1-3% for our PCR in Ireland. Considering prevalence of around 3% the majority of our "positives" are likely false positives. He must know that, yet he's locking down our capital tomorrow.

Steve @Steve66546173 · 13h
It would only take a "false positive" rate of about 1.8% for all current daily positive tests to be false.

Typically "false positives" for medical testing can be anywhere between 0.4% to 4%.

Therefore it is important for the government to disclose the rate.

18 60 138

Down Incognito #KBF @motogpbsb · 12h
If @MattHancock doesn't answer that question very soon, we know @MichaelYeadon3 suspicions are correct. This is the critical question because if it is between 1-2%, it will prove to be scandalous for the government.

Well their estimate is 2.3%...

1 3

McLoddy @Mcomegetsome · 2h
Do you have a source? I'm sure I read 0.5% somewhere. 2.3% would provide c4-5000 false positives per day which can't be right.

5 2

Down Incognito #KBF @motogpbsb · 2h
The fundamental problem is the sheer volume. We're at a million tests a week. If we had 50k+ positives you could almost live with 5k being false if the rate is 0.5%. But the no. of positives is too close to a potential false rate, especially when it picks up old RNA fragments.

1 5

Kudos - exactly right. When virus prevalence was high, 30% tests were positive. Might be more concerned about false negatives.

Once prevalence is v low, 1:2000, almost ANY % FPR destroys assays in surveillance mode.

Which is why Barker wrote to SAGE, warning not to use it.

"Morrison said a better threshold would be 30 to 35, while Mina said he'd recommend setting the threshold to 30 or less."

Carl Heneghan recommends PHE associate positives with cycle thresholds <30 or >30. This based on work showing virtually no virus culture in latter patients.

It's not necessary to test everyone all the time.
The pandemic is fading away everywhere.
That's what respiratory viruses do, as we were reminded by Prof Johan Giesecke six months ago.

> **Carl Heneghan** @carlheneghan
> At some point we'll realise the need for an evidence-based approach: until then the 'nonsense' will continue twitter.com/deeksj/status/…

When you say 64 have died in what 6 or 7 weeks? Less than 10 a week? (I assume with covid19?).
That's 1 of 2 a day.
It's not even in the Top 15 leading causes of death.
Flu is currently killing 3-5x as many as this ordinary virus.

3 4 15

Malhaus @ThomasJ06819543 · 3h
Confirmed: 64.

Nationally, 'excess deaths' have been negative for all but two of the past 11 weeks. We know Covid has killed people, and we're told to expect excess deaths from foregone treatment, so a mystery as to why overall deaths (without prejudice to cause) are so low.

1 1

Wayyyyyyyyyy @SquidiaUK · 2h
Do you think they lied about the numbers of admissions and deaths earlier in the year? Can we believe any numbers at all?

1 1

I don't know. At the time I didn't question much, until it was clear the pandemic had turned violently downwards. Daily deaths fell relentlessly for five months, one week: no reversions. Too late for lockdown to do it, way too early for masks. It's emerging population immunity.

Hancock on Julia Hartley-Brewer has impliedly admitted that the Pillar 2 testing false positive rate is “under 1%”.
It’s 0.8%, I believe. If it was lower, he’d have said “under 0.1%”.
We will compute the fraction of positives in Pillar 2 which are false. It’s most of them.

Here's a paragraph from a SAGE report... IMO though, the very top of the command chain would be the so-called Cabal, with particularly R0ckefellrs (Big Pharma, A.I. Societal Control via DNA manipulation, tracking, etc) at the helm.

Coronavirus (COVID-19)

Research and analysis

Options for increasing adherence to social distancing measures, 22 March 2020

Persuasion

2. *Perceived threat*: A substantial number of people still do not feel sufficiently personally threatened; it could be that they are reassured by the low death rate in their demographic group (8), although levels of concern may be rising (9). Having a good understanding of the risk has been found to be positively associated with adoption of COVID-19 social distancing measures in Hong Kong (10). **The perceived level of personal threat needs to be increased among those who are complacent, using hard-hitting**

Here's a paragraph from a SAGE report... IMO though, the very top of the command chain would be the so-called Cabal, with particularly R0ckefellrs (Big Pharma, A.I. Societal Control via DNA manipulation, tracking, etc) at the helm.

That would be great, except it's madness to chase around looking for respiratory viruses. There are dozens. There is nothing particularly remarkable about this one. We don't do this with flu. And the test is literally worse than useless. I'm going to put a stop to it.

JHB asked him how many patients with Covid19 are in hospital in Bolton. Hancock said lots. JHB noted that it's "Two".

Yes I've tagged you into the daily fail article, two people out of a population of c285,000. It's a disgrace what the London based morons are being allowed to get away with doing to the North of England.

1 3 7

awake in the southwest @awake26834454 · 16h
What do you mean ?

1

511#KBF @511Kbf · 16h
Bolton is locked down again, lives lost and businesses ruined, it apparently has the highest "infection rate" in the country. The town is huge and there are just two cases in hospital and no details of age or underlying health conditions.

At if it was 50, I'd feel the same. It's the height of human arrogance that our politicians imply we can "control the virus". Nonsense. We will however reach an awkward equilibrium with it soon, as we have with 100s of others viruses. We're much closer to the end than the middle.

The range for false positives for closely related tests is 0.8-2.3% or similar. Anyway, even 0.1% is WAY too high to use in a mass screening/surveillance role.

Yardley Yeadon @MichaelYeadon3 · 17h
Hancock on Julia Hartley-Brewer has impliedly admitted that the Pillar 2 testing false positive rate is "under 1%".
It's 0.8%, I believe. If it was lower, he'd have said "under 0.1%".
We will compute the fraction of positives in Pillar 2 which are false. It's most of them.

46 275 638

oldbexleyboy @Oldbexleyboy · 15h
Assume a false +ve is defined as no RNA present at all rather than small amt (RNA strands ?) being detected due to sensitivity of test (hi cycle count) ?

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Oldbexleyboy

Yes, a FP appears even if there is zero target RNA. So, 80 for each 10,000 people, with just 10 genuine positives (some of the latter are "cold positives", with broken pieces of virus) if prevalence is 0.1%.

MutantPlant @PlantMutant · 16h

I've read somewhere recently that hospital admission +ve rate were 0.45%, ie if they use the same testing approach, isn't that bounding and hence it can't be as high as 0.8%?

What I don't know if whether it varies from lab to lab.

This is critical though - 0.8% is huge!

5 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @PlantMutant

Yes, around 0.4% on admission. It can be different as it depends on many factors. I think it is 0.8%. That's the minimum value of all Pillar 2 batches.

Re false positive rate implications in Pillar 2.

It's been suggested to me that the lowest positivity rate in Pillar 2, perhaps in July, was around 0.8%.

Can anyone help me with this? Is it true? If so pls link to data.

If it's a different value, pls let me know.

Thanks :)

BANG ON.

Those who understand these things know that we'd not drop the March peak by much as prevalence was 30% in Pillar 1 at that time.
But Pillar 2 prevalence is 0.05-0.1. Fully 90-95% of the Pillar 2 positives are false.

David Williams @dave__uu · 2h

Modified is probably more accurate but: the rate of increase is what matters right now and the cause for concern. Rate of increase is independent of higher relative false positive rate during low prevalence.

If we get anywhere close to first peak again we've certainly failed.

1 2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @dave__uu @UKCovid19Stats

Agreed.
But we won't.
The rate of transmission is much slower, looking at all more developed datasets including Spain.
Notice there's no increase in London. These observations are not accidental but evidence of underlying processes

"LOCKDOWN " measures cause real harm..

Surely we need to see a definite and sustained increase in covid MORTALITY before introducing new restrictions??

1 2

David Williams @dave__uu · 2h

If most covid deaths happen approx 3 weeks after infection, and infections are doubling every 8 days, if you wait for the increase in deaths you've probably already lost control: three weeks after new restrictions many deaths like first UK peak.

5 1 6

martin brothers @brothers1980 · 2h

The notion that you can control through anything other than total lockdown needs to go, we can't, and as we don't want to and can't for many reason live through continuous lockdown we have to learn to live with it and manage risk

1 3

David Williams @dave__uu · 2h

"Control" includes managing risk with local increased social distancing for limited periods. When vaccine arrives hopefully enough people take it so we don't have to do that. Losing control means breaking hospitals. Total lockdown is the route to regional elimination.

2

Patrick Fielding @PatrickFieldin6 · 3h
Thank you.. although based on some assumptions this gives a much better idea of the degree of current position..

"LOCKDOWN " measures cause real harm..

Surely we need to see a definite and sustained increase in covid MORTALITY before introducing new restrictions??

1 2

David Williams @dave__uu · 2h
If most covid deaths happen approx 3 weeks after infection, and infections are doubling every 8 days, if you wait for the increase in deaths you've probably already lost control: three weeks after new restrictions many deaths like first UK peak.

There is a very greatly reduced susceptible population now. That isn't in doubt.
The size of the outbreak will be very much smaller. It cannot really be prevented. It's hubristic to believe hype that one can.
It's now well within the capacity of the NHS to cope.

The notion that you can control through anything other than total lockdown needs to go, we can't, and as we don't want to and can't for many reason live through continuous lockdown we have to learn to live with it and manage risk

1 3

David Williams @dave__uu · 2h
"Control" includes managing risk with local increased social distancing for limited periods. When vaccine arrives hopefully enough people take it so we don't have to do that. Losing control means breaking hospitals. Total lockdown is the route to regional elimination.

2

martin brothers @brothers1980 · 2h
Hospitals were never broken when it was rampant before and there's no suggestion it will be now. Agree that shouldn't be allowed to happen. Local 'restrictions' don't work as we can see from here and around Europe.

1

David Williams @dave__uu · 1h
Some hospitals had to close for periods and overall there was a major reconfiguration of hospital capacity with a severe impact on non-covid care. We are better off controlling it. Not sure why you think local restrictions don't prevent transmission.

Unknown to us as media is monocular but flu has been a bigger killer than covid19 for last several weeks.
There is no plausibility that the new 'ripple' will be more than a small fraction of the spring deaths.
We now must seek perspective & proportion or we'll repeat errors.

a risk that traditional flu patients are going to test positive for COVID with this test being used?

I'm happy to be corrected (politely) by anyone if there's a good reason that won't happen?

4 1 8

Elsie Campbell @MidgetGem1632 · 3h

No. The antibody test can pick up different strains of coronaviruses such as flu. But the PCR test for current infections is specific to the RNA of the COVID-19 strain only. So should only pick up Covid 19 positive cases - now if those are currently infectious, is another matter

5 2

The PCR test in community testing delivers 9 false positives for every genuine one. Scandal.

Not all genuine positive is a case (that is, not ill).

Regret to repeat: median age at death of/with covid19 is 84F/81M.

Every help should be provided to vulnerable. That's it.

5 2

Jan #NHSLove @janbayly · 2h
Not correct. Test looks for RNA from covid. It is treated to make it detectable in cycles. Fresh infectious RNA shows up after 25 cycles. Old non infectious breaking down RNA is detectable after 35 cycles. The test is set at 35 cycles so that means some positives aren't.

2 1

That's correct. Divide by ten.

Up to end August I would advise divide by 20 (background prevalence was a little lower).

Appalling however sliced & diced.

If I may, Ill use this in a short document I'm writing which gets exactly to that point.

Would you be willing to send it to me?

I've a request: can you add a plot with the little ripple being 10x smaller?
This because the FPR means actual'cases' are 10x less than Hancock says

That would be great, except it's madness to chase around looking for respiratory viruses. There are dozens. There is nothing particularly remarkable about this one. We don't do this with flu. And the test is literally worse than useless. I'm going to put a stop to it.

samedaydoctor @samedaydoctorUK · 2h

Is the issue not with false positives but more that presence of a fragment of RNA does not mean anything? This is not an actual false positive but still meaningless probably.

2 2

Elle @HelenaHannCarte · 38m

Really good point. Carl Heneghan argues that we should limit the number of cycles to that which produces a positive that is likely to be infectious.
I personally think we would be better off doing what China did and only classing symptomatic cases as cases (correct me if wrong)

1 1

Yardley Yeadon
@MichaelYeadon3

That's true too. But let's allow for now that "they're real positives" in the sense that PCR seems viral RNA. I agree we then need to ask "what fraction of positives are 'hot', intact, infectious RNA?"

I don't know because Govt won't share the cycle thresholds with positives.

False negatives are far more dangerous. These allow infected patients with symptoms to return to work. Carehomes, hospitals are at risk and masks won't help

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @GrumpyPete

Wrong. Mostly people are negative. If we miss a few we're where we are.
MUCH worse is the catastrophic over estimate of cases.
All epidemiologists will agree: when prevalence is low, a false positive rate that is larger, especially much larger as is the case here, destroys value.

See Clare Craig's analysis in The Spectator this week.
Interesting
If anything it bolsters the high FPR issue.

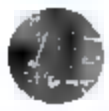
@d_spiegel hi, please can you take a look/listen at this interview with Matt Hancock and use your expertise to help me explain why FPR "under 1%" isn't as good as it sounds?

> **Julia Hartley-Brewer** @JuliaHB1
> THIS IS VERY IMPORTANT: Matt Hancock told me on @talkRADIO that the False Positive Rate of Covid tests in the community is "under 1%". Sounds good, doesn't it? WRONG!
> An FPR of 0.8% when the virus prevalence is so low means that at least
> Show this thread



29 92 258

David Spiegelhalter @d_spiegel · Sep 18

If you test 1000 people at random, latest ONS figures estimate 1 will have the virus, and let's assume you find them. But with an FPR of 0.8%, that's 8/1000, and so you expect to find 8 false positives. That's 9 positive tests, only one of which has the virus . Hope this is ok

Re false positive rate implications in Pillar 2.

It's been suggested to me that the lowest positivity rate in Pillar 2, perhaps in July, was around 0.8%.

Can anyone help me with this? Is it true? If so pls link to data.

If it's a different value, pls let me know.

Thanks :)

11 12 44

Naomi Bridges @nnnaomi · 3h

This is from the gov's own literature. "Results of 43 EQAs were examined, giving a median false positive rate of 2.3% (interquartile range 0.8-4.0%)."
assets.publishing.service.gov.uk/government/upl…

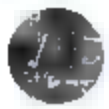
I am so tired and need just one figure to complete my article. Impact might be strong so I am being careful.

I thought I'd asked earlier if anyone had a rebased graph showing approx what cases would have looked like through the spring phase of the pandemic?

1

Yardley Yeadon
@MichaelYeadon3



Follow

I'm cross that the Pillar 1 cases are shown daily on the same axes as the recent case increases.

If we adjusted the spring part of the plot upward by (what? 10x more?) and then also adjusted the recent increase downwards by 10x, that being roughly the over count resulting...

Yardley Yeadon @MichaelYeadon3 · 24s

... from Pillar 2 because of a high FPR, we would have a much fairer representation of what's happening.
I feel if I can't put this in, I'm going to lose the whole essence of why it matters that there's huge over estimates of current cases.

Mark Stronge @markoftec · Sep 18
Seriously mate, have you looked at the PCR tests? If you test 1000 people at random, latest ONS figures estimate 1 will have the virus, and let's assume you find them. But with an FPR of 0.8%, that's 8/1000, and so you expect to find 8 false positives. That's 9 + tests, 1 real

1 1

Kieran @kizzlenik · Sep 18
That's not a thing, otherwise it would mean only 1 in 9 positives were real. Pretty sure 0.8% is of positive cases. Eg you test 1000,000 people 1000 people test positive of those 1000, 8 are false positive.

5 2

Yardley Yeadon
@MichaelYeadon3
Follow

Replying to @kizzlenik @markoftec and 3 others

The PCR test is great. However like all tests used in statistically extreme conditions, it fails. Specifically it fails because the not unusual false positive rate is very much greater than the prevalence of the virus. When 30% of samples were positive, 0.8% FPR was irrelevant.

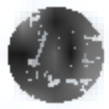
Yep, same. Nobody thinking through the long term collateral damage of the measures we were taking. Nobody thinking that the damage may actually be worse than the lives saved by the measures - if any really were saved by them?

1 4

ValonD @SkiLaTzoumaz · 18h
they have based models on the premise that healthy people with long lives ahead would die, those are the exception so they have saved very few lives, kicked the can down the road for some, all at enormous cost, cost would not get past NICE for cancer tx



> Generally, we consider that interventions costing the NHS less than £20,000 per QALY gained are cost effective. Those costing between £20,000 and £30,000 per QALY gained may also be deemed cost effective, if certain conditions are satisfied (see section 6.4.1 of 'Methods for the development of NICE public health guidance' 3rd edition).

1 2

... from Pillar 2 because of a high FPR, we would have a much fairer representation of what's happening.
I feel if I can't put this in, I'm going to lose the whole essence of why it matters that there's huge over estimates of current cases.

2 3

Jack Silence @JackSilence47 · 8h
Yes, the particles are airborne. Worse than that, the virus is so small, 1000 times smaller than bacteria, that it is virtually unstoppable even with the N95 mask as 5% of the virus will still get through. You won't won't ever be going back to normal. Stay inside. Don't go out.

1

Dina @Dina08082483 · 8h
It's been said that the less amount of the virus gets into the body - the easier the course of a disease would be.

1 1

Jack Silence @JackSilence47 · 8h
Not this virus. This virus will flat out kill you dead. Even 1 particle would be enough to make you very sick. That's how deadly it is! Listen to the media. Stay inside. Don't go out. Your life may depend on it.

2

Dina @Dina08082483 · 8h

Mmmm.. no. It has to be a particular amount of this virus to make a person sick. That's why wearing a mask is important.

1 1

Jack Silence @JackSilence47 · 7h

I wouldn't risk it. Stay home, Don't go out. And it is best that if you live with anyone there should be 24 hr separation between family members with everyone in separate rooms. No touching, and no contact till at least April of 2021.

2

Jack Silence @JackSilence47 · 7h

Yes, wear your mask as much as you can. Get some oxygen if you have trouble breathing. Also, when the 3rd wave hits in April, I strongly suggest we lock down for another 6 months just to be safe.

Julia, if we accept your 'understanding' you still wont explain why the FPR has fluctuated? Testing is an indicator. All testing of any virus has an FPR. Why are you so dogmatically set in ignoring the confirmatory data that hospitalisations with CV+ are doubling every 8 days?

1

Yardley Yeadon
@MichaelYeadon3

Replying to @DeplorableVote @JuliaHB1

The hospitalisation are rising but by nothing like we are being told.
In Spain, region by region, they have had a sharp, but individually small, increases in deaths. This absolutely isn't a runaway consolidated growth in deaths. Look at the individual regions. This is important.

No, the test in that graphic has lower specificity than the actual test. The important point is the 5% infected.

3 1

Birko @birkotweet · 48m
No, the important point is the number of people tested. 250k tests with a FPR of 1% is 2,500 wrong "cases" per day. The solution is immediate repeat testing to confirm genuine positives. Then we can deal with the amount of amplification cycles being way too high!

2 2

Yardley Yeadon
@MichaelYeadon3
Follow

Replying to @birkotweet @_Paul__ @JuliaHB1

Absolutely - repeat is all that is required to solve this.

I will be demanding that this easy, cheap & powerful step be taken with positives (refinement would be not if low cycle threshold & symptomatic).

Too big an ask? NO: until 2020, re-test was the global gold standard.

2 3

Paul @_Paul__ · 1h

Not quite. The important point is not the total number of people, it's the prevalence of the virus amongst the group you are testing. If you can keep that high - test symptomatic people only - the test will provide good results.

2

Replying to @_Paul__ @birkotweet @JuliaHB1

Its the relationship between prevalence & the FPR.

If prevalence is similar to FPR, test will identify approx equal real- & false-positives.

This high throughout test will always have a FPR way too high for use in community.

Unless re-testing is introduced, Pillar 2 must cease

It occurs to me that Pillar 2 results & hospitalisation/death are COMPLETELY unrelated. No wonder we've an apparent 'surge' in cases yet not seen a time-shifted but related surge in hosp/deaths.
As my calculations show, Pillar 2 yields almost nothing but false positives.

To be clear, I'm not saying there aren't (or couldn't be) more people going to hospital & have tested positive for covid19.
I am saying that in many cases, the test result isn't the REASON they've been admitted.
Similarly, for most deaths, the presence of virus isn't the cause.

Replying to @ShaliniVarma11 @ProfKarolSikora

It's a deliberate act to keep the NHS as lightly loaded as possible, because Prof Ferguson's model says there'll be a second wave (there won't be).
Eg Neurology 40% down
ICU beds nearly a quarter empty so electives like mitral valve replacement are far fewer than needed.

I agree prevalence might be a little higher but you must see that even to make that case, you have first to have evidence that there's any more virus there the other places.
Source of that evidence? Pillar 2 testing.
The extent of increased prevalence needed to major the sums...

2

Yardley Yeadon @MichaelYeadon3 · 55m
...to make the sums add up are just implausible. And you're surely kidding on 4% prevalence?

2

Peter Duckworth @GrumpyPete · 34m
Just quoting @d_spiegel I don't know what the true figure is. Certainly the hospital admissions and deaths don't support 4%

Although I agree with much Michael says his assumption that the prevalence for those tested is the same for the general population i.e. 0.1% maybe too low. The testing is not on a random sample of the population but on those with symptoms or at risk of infection. Prevalence 4%.

1

Yardley Yeadon @MichaelYeadon3 · 57m

2

Peter Duckworth @GrumpyPete · 39m

The figure of 4% was quoted by @d_spiegel as a PHE estimate. As there is no split on the testing population between random and symptoms we can't know. My worry is the government will quote David to rubbish your figures which would be totally unfair and wrong.

True. ONS timeline shows that even at the height of the spring pandemic, we were never close to that value.
ONS showed 0.05-0.07% most of the year edging up to 0.11% latest. 4% is EIGHTY times higher than July for example. Utterly implausible.

David Spiegelhalter @d_spiegel · Sep 18

Tweet below is for mass testing. Very different if test 1000 people "with symptoms". then from PHE data expect 40-50 covid, detect say 30-40. So most positive tests are correct. The current rise is real.

> **David Spiegelhalter** @d_spiegel
> Replying to @JuliaHB1
> If you test 1000 people at random, latest ONS figures estimate 1 will have the virus, and let's assume you find them. But with an FPR of 0.8%, that's 8/1000, and so you expect to find 8 false positives. That's 9 positive tests, only one of which has the virus . Hope this is ok

But David: this is the point. The vast majority turning up for Pillar 2 don't have symptoms. Mr Hancock got a little cross with all those school kids, students & workers being told "don't come back until you've a negative test".

Tell you what, though - lets just arbitrarily lockdown the country with a known useless but lethally damaging intervention.

Influenza from now to spring is likely a bigger threat than us covid19 over same period.

Why isn't this obvious? It's not a miracle virus.

the French senate, Didier Raoult, the hospital's head, said analysis of Covid-19 tests in the summer had revealed seven mutations of the virus. One appeared to have been brought to the city by people crossing from north Africa after ferry links were restored in late June after lockdown ended, he said. It disappeared again last month, to be replaced by other mutations.

"We compared 100 cases from July with 100 before … They are less severe, so something is happening with this virus, which makes it different." Raoult, 68, told senators. "The mutations we have are a rather degraded version of the initial form. At least that is our impression."

are able to draw on massive amounts of data. After the first cases of the virus were reported in February, the hospital quickly pioneered mass testing for anyone who wanted it. This was said to have helped Marseilles escape almost unscathed the first wave of the virus, which struck hardest in the regions around Paris and Strasbourg, in the northeast.

As the number of cases has risen across France in recent weeks, Marseilles has found itself cast as a coronavirus hotspot.

French official figures showed 222.3 cases per 100,000 – compared with a national average of 88.6.

No need to speculate: data on exactly this issue is constantly collected (it was early on at any rate) which I think of as "forensic virology". By comparing full length RNA from thousands of clinical isolates, clever people can work out the transmission patterns around the world.

Remarkable graph. Unsure, is this fully up to date?
It does appear that the overall "positive rate", which I'd expected. Truthfully I had no basis for guessing WHEN!
I will say, I'm finding the shape of the curve reassuring.
I'm painfully aware that it's prob false reassurance.

Writing On The Wall @Mountain_ally · 2h

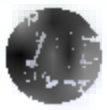
Michael Yeadon, not sure if you will see this? Perhaps I'm 3 days to late too!

I have looked at Desmond Swayne's personal blog and he states that he does not read his posts on social media.

However, I have grabbed his email address ...

receive 200 emails in a single day.
Over recent years email correspondence has grown exponentially, so much so, that increasingly I have to ration my responses. Some constituents complain that I am rude. I dispute this. Certainly, I dispense with salutations and answer the question asked without preamble. I accept that I am brief - I have to be.

Whilst I read all the email I receive, I will make a judgement as to whether an automated acknowledgement is a sufficient response.
I confess however, that I do not read any messages sent to me via social media. So



Write to
Rt. Hon. Sir Desmond Swayne TD MP at
House of Commons, London, SW1A 0AA

Email to
swayned@parliament.uk

Please make sure that you give your full postal address on every item of email correspondence that you send to me.

In line with data protection regulations, my office processes constituents' data for casework and policy query purposes under the lawful basis of public task. In instances where this lawful basis is not sufficient and

I also don't subscribe to conspiracy theories.
The facts are clear. Fully 90% of the positives from Pillar 2 testing since June are FALSE POSITIVES.

2 6 19

Peter Chapman @pe51ter · 10h
Currently about 200,000 tests per day. False + rate of 0.8% gives 1600 false positives. But about 4000 are testing positive. So you have to explain away the 2400.

2

Andrew @AndrewThinker · 6h
Taken from ONS stats for England (worse area for 'cases' rising.

"Based on statistical modelling, we estimate that during the most recent week of the study (19 to 25 August 2020), there were 0.36 new infections per 10,000 people per day (95% credible interval: 0.21 to 0.58)."

1

Andrew @AndrewThinker · 6h
With FPR of 0.8%, 80 people would test positive per 10'000. Based on ONS statistics - prevalence at under 1 person per 10k. 79 out of 80 positive tests are false. Out of your 4000, 50 people are positive 3950 are false positives.

1 1

Although I agree with much Michael says his assumption that the prevalence for those tested is the same for the general population i.e. 0.1% maybe too low. The testing is not on a random sample of the population but on those with symptoms or at risk of infection. Prevalence 4%.

3

Yardley Yeadon @MichaelYeadon3 · 12h

I agree prevalence might be a little higher but you must see that even to make that case, you have first to have evidence that there's any more virus there the other places.
Source of that evidence? Pillar 2 testing.
The extent of increased prevalence needed to major the sums...

2 2

Yardley Yeadon @MichaelYeadon3 · 12h

...to make the sums add up are just implausible. And you're surely kidding on 4% prevalence?

2 2

Peter Duckworth @GrumpyPete · 11h

> **David Spiegelhalter** @d_spiegel
> Tweet below is for mass testing. Very different if test 1000 people *with symptoms*. then from PHE data expect 40-50 covid, detect say 30-40. So most positive tests are correct. The current rise is real.

I also don't subscribe to conspiracy theories.
The facts are clear. Fully 90% of the positives from Pillar 2 testing since June are FALSE POSITIVES.

2 6 19

Peter Chapman @pe51ter · 10h
Currently about 200,000 tests per day. False + rate of 0.8% gives 1600 false positives. But about 4000 are testing positive. So you have to explain away the 2400.

1

I don't need to explain then away.
Some of them are real.
That daily rate is around 1-2% of peak.
Notice how snail like is the pace.
As you'd expect now that the % susceptible is low.
This will turn over with no interventions. As we're seeing in some Spanish regions.

We really don't have data to say it's spreading.
What we've got is an assay which yields 10x overestimates of 'cases'. This & this alone is what's driving anxiety & over eagerness to apply more "coercive control". We can't say it's spreading, because we didn't test like this B4.

Great article. The ONS weekly report showed only 28% of "positives" had symptoms. Based on the FPR is it a fair assumption that the other 72% were likely the FP?

ons.gov.uk/

Only around 28% of individuals testing positive for COVID-19 reported having symptoms

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @stevendq

I'm not sure. ONS themselves concede that if the virus was NOT circulating, they might have seen the same numbers of positives. Yes, I wondered about that, too.

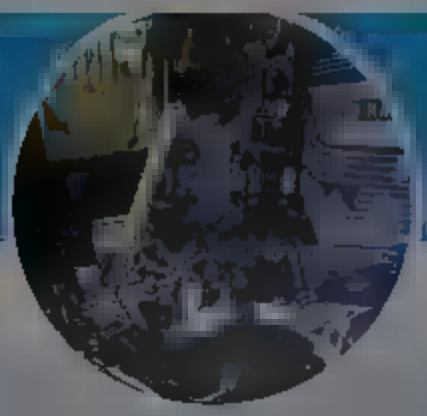
and has been relentlessly repeated ever since. I was interviewed recently by Julia Hartley-Brewer on her talkRADIO show and on that occasion I called on the Government to disclose to us the evidence upon which they were relying to predict this second wave. Surely they have some evidence? I don't think they do. I searched and am very qualified to do so, drawing on academic friends, and we were all surprised to find that there is nothing at all. The last two novel coronaviruses, Sar (2003) and MERS (2012), were of one wave each. Even the WW1 flu 'waves' were almost certainly a series of single waves involving more than one virus. I believe any second wave talk is pure speculation. Or perhaps it is in a model somewhere, disconnected from the world of evidence to me? It would be reasonable to expect some limited 'resurgence' of a virus given we don't mix

1 2 6

Yardley Yeadon
@MichaelYeadon3

Follow



Replying to @WonPeople @toadmeister

I too found it surprising that there's a paucity of evidence & predictions about 2nd waves. Because there's a strong sense that a 2nd wave is expected by Govt, media etc.

I get the point the report is making but where is the evidence of that percentage of tests being false positive? The report does not seem to provide the data to support this and all the maths is based on it. Would be interesting to find out where that number has come from.

3 2

CovidBard @CovidBard · 19h
And the 0.1% comes from the ONS survey

1

bad takes bot @badtakesbot1 · 16h
If the ONS can measure the virus prevalence as 0.1%, the false positive rate of the test must be 0.1% or lower.

If the false positive rate was 0.8% as @JuliaHB1 claims, the ONS would never be able to measure a lower prevalence than that.

1 1

CovidBard @CovidBard · 8m
I believe the 0.8% was govt lower bound estimate of FPR. 1/1000 was the prevalence reported by ONS presumably by a more lab controlled deployment of the analytical technique?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @CovidBard @badtakesbot1 and 3 others

Yes, that's my interpretation. It's certainly not true that the same test gives the same FPR regardless of who conducts that test.
There is a large number of steps where errors & variation can be introduced.

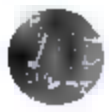
Phil Uttley @catellus · 19h

This claim is bullshit, because it assumes that people in Pillar 2 testing (who are usually tested because they have symptoms!) have the same prevalence of the virus as random people from the population (most of whom won't have symptoms!).



2 8

Phil Uttley @catellus · 19h

The false positive rate should be compared with the prevalence of the virus *among people who decide to get tested* (usually because they have symptoms!) not the general population. This prevalence will be much higher than 0.1% so actual numbers of false positives much lower.

4 15

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @catellus @JuliaHB1

How much more, exactly?
If general prevalence was 0,06.% by how much is it enriched?
If still below 0.8%, the test is mostly False positives.

an example of a test which is FAR more accurate than the Covid-19 tests being used in the community. The maths

Show this thread

14 43 144

Neil Barrett @dr_barrett · 5h

I think the sensitivity is actually much lower , 70% because it's dependent on a good sample. The specificity is obviously higher than quoted - I think the point with CT values is you don't know if they are on the way up or the way down , and the sample is not standardised

2 1

DrNick-WearAMask&limitcontacts @DrNickB_ObAnaes · 5h

Specificity at worst case is better than 99.96% - sensitivity is only moderate - in testing an enriched population ie: symptomatic/contacts the major issue is risk of FALSE NEGATIVES

I'm sure you mean well. But finer aspects of how the primers match the virus, etc are irrelevant. Issue is - as used in mass testing in the field - Pillar 2 testing yields a false positive rate of just under 1%. Analytics 101. When prevalence is <<than FPR, yield is mostly FP.

The projections are completely implausible and cannot be created from the hopelessly imprecise model without adopting numerous incorrect assumptions.
My clever graduate daughters spotted several howlers during the presentation.
Neither are science grads.
Its that bad.

Odd that no one - ever - indicates the 'cycle threshold' on these "positive cases" (smaller # amplifying cycles needed to turn positive, the more virus/viral genes). It greatly increases diagnostic power if a LOW cycle threshold, like 25. We running ours sometimes to 45.

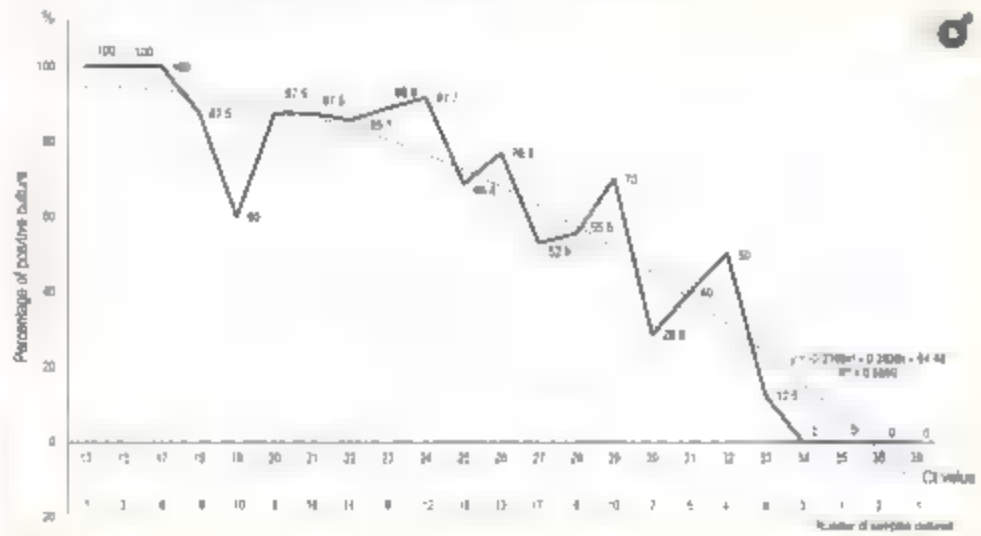

Fig. 1

Percentage of positive viral culture of SARS-CoV-2 PCR positive nasopharyngeal samples from Covid-19 patients, according to Ct value (patient-line). The dashed curve indicates the polynomial regression curve.

We now know, because helpful Swedish scientists shared their results, that ANY so-called positive PCR test, if it occurs at cycle threshold over 32-ish, should be called negative (for CV-19) as we can't culture virus from the patient's sample. Watch how Ct alters with time, too.

coronavirus.data.gov.uk/healthcare?are...

40 316 700

Shane @BbqShanes · 7h

Entirely possible that there were 4000+ covid cases per day back in April. We don't know because we weren't testing as many people back then.
Cases is such a bad way to measure when the testing rates are constantly increasing.

Follow

Replying to @BbqShanes @AlistairHaimes @LukeJohnsonRCP

I believe it's entirely possible there were 100,000 cases per day, and it was in mid-March, not April.
The pandemic had slowed in its expansion & R was inferred to have fallen below 1, all before 'first lockdown'.

Replying to @ImDarrenDunn2 @ClareCraigPath

Agree, and this is why it's completely invalid to use serology alone to estimate the aggregate number of infections.

It's ridiculous if this turns out to be true.

Sure, there are 4 endemic CoVs which together contribute 1/4 to a 1/3 of colds.

But if PCR primer design failed to worry about this, them we can all go home.

5) We aren't islands, and in taking risks because we consider ourselves 'low-risk', we can't help but create risk for others - eloquently put by @CMO_England this morning -

> **Jake Dunning** @OutbreakJake
> @CMO_England considers the question can't people just be allowed to take their own risk? He said "if I as an individual increase my risk, I increase the risk to everyone around me, and then all of their contacts". Spot on. Societies acting collectively are achieving the most.

2 7 90

Isobel Braithwaite @izzybraithwaite · 7h
6) 'Throwing protective rings' etc sounds easy, but we know that we can't effectively protect vulnerable people when community transmission is high - we're too connected & interdependent. UK tried in the first wave, and it went badly, leading to 1000s of deaths in care homes.

5 15 74

Yardley Yeadon
@MichaelYeadon3
Follow

Replying to @izzybraithwaite

I agree. Where we may part is the next, that you can lower community transmission without so tightening things down that more people die than might be saved.

I've seen no evidence for that.

Well said, Sir Desmond!
1. The lethality (fraction of those infected who die, assuming representative sample infected) is MUCH lower than we first thought. My own calculation is around 0,3%: a little worse than average 'flu & similar to bad flu. Fact is we'll be wrong. History...

Consider what's the ratio of asymptomatic vs mild vs severe cases? I came to conclusion that 17% hugely underestimates % infected. I'm plumping for 3x. That's the basis of my 50% in London. Intriguingly, whatever it is, it's so far enough to block re-emergence on scale, in London

1

Yardley Yeadon @MichaelYeadon3 · 15m

I accept this line of reasoning isn't robust (to put it mildly!).

But those who prefer other ways to think about things, would you pls share why you think we're not seeing cases shoot up exponentially in London? Thanks.

The tough news but also hopeful info is that this is definitely self-limiting. There's nonsense talked of 'no immunity' or 'immunity doesn't last'. So it will conclude & sunset. If a safe/effective vaccine becomes available, perhaps 10% pop might elect to accept it.

I saw that from Ireland & it has the ring of truth to me. With UK +ve's recently running at ~1.7%, that would mean our 'cases' (infections) are being overstated by ~75%.

But irrelevant - *only* hospitalisations & deaths matter!

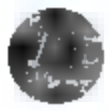
Check how many daily deaths occur at height of a moderately bad flu season where say 40k die.
It's surprising that we don't lock down for such numbers, potentially 2x worst case covid19 ripple

3 2 6



PaulFoster68 @PFoster68 · 9h
I think they are worried about all respiratory illnesses out together. not helped by all the mask wearing and anti social distancing. ?

1 1

#internetBillofRights #Standup4Brexit Retired GP @jenninemorgan · 9h
Odd how flu deaths dropped to just over 1000... while so-called covid deaths rose to take their place...in my opinion as retired GP... who knows what they really died from as death certification rules were changed by ONS. Even terminal cancer & heart disease etc put down as covid

Sorry, that isn't what he told Julia Hartley-Brewer last week. Sure, the 0.8% bit, correct, but to a f-up Q, he told a serious untruth. He said of positive tests, "the probability any of them are false positives is very low". That's not true, it is? (I listened multiple times).

Do these government ministers think the false positive rate relates to the test result rather than the total tested? Grant Shapps had no idea either when pressed by Julia, he confirmed there had been no discussion in the cabinet about false positives either.

From an exchange above your question I think 'all'.

Not used to looking at data like this and don't know what we'd see for prior years same dates.

Can anyone help by plotting data for September last few years, so we can get a better sense of what it's telling us?

You do realise that he was the Chief Scientific Advisor at Pfizer?

1 1

Jo Norwich @joannenorwich · 4h
I don't care if he's Winnie Mandela's nit nurse!

Seasonal flu kills between 300-650k globally a year. Covid has already killed almost a million since March.

In the UK, it's approx 17k a year. Covid has killed over 40k in six months.

2

Jo Norwich @joannenorwich · 4h
And that's WITH huge lockdown measures having taken place in most countries.

Without it, the figures would undoubtedly be much, much higher.

2

Akh40 @Akh403 · 1h

Here are answers to some questions that I get asked quite a lot.

English hospital date-of-death series is published by NHS England. The Govt number reported is bigger as it covers the whole UK, includes all deaths & is not by date-of-death so includes deaths from earlier dates.

17 30 164

Stephen Sawrey @scs1304 · Jun 30

Stupid question.are Pillar 2 tests broken down by LA?
Leicester. no one seems to have definitive stats
Why are deaths outside hospital so high relatively? Assumption of COVID? And Bournemouth on the list..is it too soon to conclude following last week? Keep up the good work..

3

Yardley Yeadon

May I ask why you assume increased deaths at home are caused by Covid19? Pls correct me if I've misunderstood what you said.
I'd have thought the opposite. People with Covid19 are seem extremely promptly so increases at home I'd guess are everything but Covid19, as in spring.

It's not even "totally new". The coronaviruses family has hundreds of members, 4 of which are endemic & cause about 1/3rd of common colds. These are closely related to SARS-COV-2. That's why it appears 30% of population were already immune to this 'new' virus before it arrived.

10.47% of those infected have died? I do not wish to be rude, but you're out by around a 100 fold. Roughly 0.2-0.4% of infections lead to a death. 0.06% of the U.K. population. Total yearly deaths (all causes) are just under 620k. Covid19 deaths (with & of combined) 42k.

Simon Dwinder @Sidwinder75 · 17h

Using today's official government data, here's a graph of 'new cases' as a percentage of tests performed. As you can see, cases are a tiny percentage of tests.

A recent BMJ review used a False Positive figure of 5%.
Public Health England came up with slightly under 2%.

This is what the papers should be leading with. They should be shouting from the rooftops that the test data and test used to pass absurd unscientific rules is so useless for the job it could be picking up the common cold as positives. Even @PHE_uk said it was a possibility.

Why do they never consider the false negatives?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @epistatcadarn @bealelab and 4 others

They do, but FP & FN are most important under different conditions. When prevalence is high, like March in A&E, 0.8% FP was of no importance by FN mattered a lot. Now at low prevalence, opposite: FP major issue, FN not.
Do check wiki or Epidemiology textbooks 101.

Replying to @MichaelYeadon3 @bealelab and 4 others
I think I have worked out how we came to be talking at crossed purposes! Yes you are right.
We all agree specificity & Sensitivity matter in screening.
What worries me is in the UK case identifying situation, dismissing the false negatives will lead to new pockets of infection.

Adam Knight @APK_musicreview · 18h
Only 17% antibodies in London according to Chris Witty and 8% nationally or was you accounting for T-Cells too?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @APK_musicreview @DesmondSwayne

Yes, mostly,
I'm not sure antibodies are particularly important vs this virus.

T-cell responses incl memory can be both robust AND durable (17+ yrs in case of 2003's SARS).

Seroprevalence: poor way to estimate population immunity. You can x2 or x3 ROUGHLY for % infected.

No one knows how to confidently determine % infected / immune. But I've read many papers looking at relationship between clinic state vs later developing Abs. Severe cases all convert. Milder cases don't always convert, levels lower & fade faster. Asymptomatic often DONT convert.

1 2

Yardley Yeadon @MichaelYeadon3 · 17h

Ok. It appeared that you had assumed that #HerdImmunity is way beyond 48% with #antibodies & that's why you said we have a long way to go.

1

Dr Clare Craig FRCPath @ClareCraigPath · 8h
I did imply that. I think this paper implies that we too will one day have seroconversions at that level. I don't know how rocky the road will be to get there.

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @ClareCraigPath @z1y2x3

I'm not sure we can say even that. The evidence is clear that those with severe symptoms (hospitalised for example) all seroconvert.
At the other extreme, very few seroconvert if infected with no symptoms.
I conclude seroprevalence is an unreliable guide to pop susceptibility.

I am not a doctor/scientist at all but surely herd immunity is the only strategy? That's what a vaccine attempts to do? There are certainly people around who are immune now but the Gov just ignores T cells etc. Leads to a complete lack of trust.

Correct. Probably fairer to say that reduced pop susceptibility to the point that expansion becomes impossible is a CONSEQUENCE of whatever management plan we adopt. Even vaccination is unlikely to provide 'community immunity'.

Surprising tack taken by Tim Harford on his More or Less radio show (I used to be a fan, but no longer, he having joined the ranks of the "useful idiots"). Instead of taking head-on the question as to whether Govt statistics have been lying to you all summer (spoiler: they have)

Replying to @MichaelYeadon3 @Plan3t_L0v3r and 2 others

Hi Mike, can you explain pillar 2

2 1

Grayphil @grayphil27 · 42m

Briefly, pillar 1 is the testing of symptomatic people who present at hospitals or testing centres.
Pillar 2 is the "random" testing of mainly non symptomatic people, via kits to houses, testing vans asking people to test

This useless government blew the chance we had over the summer to eliminate the virus - as other countries have successfully done.

Now I fear it's doing too little, too late - just as it did earlier this year.

Richard, a substantial part of the positives in the PCR test are false positives. Those who argue that the positivity rate has risen so FPs are less of an issue (that's probably true) seem so keen to breeze past the inconvenient truth that Govt has been lying to us all summer.

They think their best suits are lockdown & masks. It is unequivocally the case that U.K. lockdown did not significantly reduce infections & deaths in spring. On masks, an area of literature I know very well, there IS some Level 2 quality info. Sadly for Govt, it's negative.

Agree. It's saddening. Every main newspaper, TV & radio channel parrots Govt lines.
Usually, a Govt receives challenges from backbenchers, Opposition, TV/Radio & the much vaunted "4th Estate": print media.
What to conclude?
Why are none interested in digging into this more?

Presumably there still be a considerable number of the population that have avoided infection. They would still be vulnerable to future infection though this would decrease over time as other countries go through the same cycle.

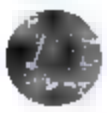
"most of which are false positives"? Looking for something slightly more sophisticated than "more testing"

7 2



Yardley Yeadon @MichaelYeadon3 · 2h
Hello. Not been doing your homework!
When the prevalence is lower than the FPR, the test can pretty much only yield false positives.
And don't try the "only those with symptoms get tested" malarkey. 1. It's not true & 2. If it was then it the general prevalence is even lower.

1 4

Simon Nicholls @sinichol · 46m
How did Pillar1/2 show a prevalence of 0.3% in July, or the ONS survey, which uses PCR, 0.05%?
As you can't sample below the FPR, it is likely 0.05%, at worst 0.3%.
As prevalence drops so does cross contamination, reducing the FPR.
As +ve rate now 2.65%, 2% are FPs, worst 11%.

2

Yardley Yeadon
@MichaelYeadon3

Unfortunately there is a section of the population who don't want to belive that there is massive issues with the PCR test. Even when you show them the SAGE minutes they come up with excuses for it.

19 It is well known that widespread use of a test with imperfect specificity in a population with low prevalence will generate more false positives than true positives. For example, suppose one were to test 100,000 people of whom 200 were infected and 99 800 were not infected. A test with 80% sensitivity and 96% specificity would find 160 true positives and 3,992 false positives. The situation can be rectified with follow-up, confirmatory testing of the 4,152 with a positive first test using a different second test that has very high specificity (perhaps at greater expense or slower turnaround). If those 4,152 individuals were re-tested with a test with 99% specificity the number of false positives would fall to just 40 – see Annex B for detailed illustrative examples. This calculation relies on the strong assumption that the two tests have independent errors.

Yardley Yeadon @MichaelYeadon3 · 19h

As author, I become more appalled daily. Critics point out that as true prevalence rises, FPs are less of an issue have missed the fact that prevalence was low ALL SUMMER.
During that time, Pillar 2 testing was a fraud, I believe a criminal matter which has killed thousands.

12 75 185

David Taylor @majesticbanana · 7h

As you drive to ramp up testing, you focus less on careful accurate testing and more on farming out tests and getting tests done, and possibly with less accurate equipment.

So the mere act of ramping up will increase the false positive rate and hence the total positive rate.

Can you explain this to me please? I'm confused because the chunkier graph at the bottom has lower numbers, but says it is the original. I thought the modified version would be where false positives are considered, and therefore lower. Cheers.

Does no one care that Govt has lied to us all summer? That's because almost all positives in Pillar 2 were false positives. The architects of Pillar 2 KNEW before deploying it that it would yield almost exclusively FALSE POSITIVES. They did it to keep you all scared. It's worked.

Spot on. Ditto London.
Note: community immunity is just that, a guarantee for the community, not possible to support a large outbreak. But individuals can still catch it& die. These are the top vaccine candidates, provided they consent.

Replying to @PaulJacklin @6631andrew @carlheneghan

Hello. Not been doing your homework!
When the prevalence is lower than the FPR, the test can pretty much only yield false positives.
And don't try the "only those with symptoms get tested" malarkey. 1. It's not true & 2. If it was then it the general prevalence is even lower.

Specimen date is the key....shows a steadier and more accurate picture of "positive test" rise (although many of these may be false at this level of prevalence) - clinical "cases" are something rather different

What is the positivity at the moment?
Obv, I was relying on Hancock's answer to Julia HB as being truthful, silly me.
The suggestion going around based on disclosures from BE & DE are making me doubt our FPR is anywhere near 0,8%.

Does no one care that Govt has lied to us all summer? That's because almost all positives in Pillar 2 were false positives. The architects of Pillar 2 KNEW before deploying it that it would yield almost exclusively FALSE POSITIVES. They did it to keep you all scared. It's worked.

> **Yardley Yeadon** @MichaelYeadon3
> Replying to @Plan3t_L0v3r @RichardBurgon @DessieMByrne
> As author, I become more appalled daily. Critics point out that as true prevalence rises, FPs are less of an issue have missed the fact that prevalence was low ALL SUMMER.
> During that time, Pillar 2 testing was a fraud, I believe a criminal matter

Paul Jacklin @PaulJacklin · 7h
That article addresses false positives. FPs can be a issue especially for low prevalence populations but the prevalence is not decreasing so increase FPs cannot explain increase in cases. 1/2

1 1

Paul Jacklin @PaulJacklin · 7h
Furthermore, that article makes no mention of pre-test probability which is more relevant than prevalence to the proportion of false positive results. We are testing based on presence of symptoms not screening. 2/2

No, we're not. We're supposed to. But that isn't what is happening.
As we learn more I no longer believe in balance that the FPR is as low as 0,8%.
I've zero confidence in this criminally broken & distorted testing system.
Such a shame as it didn't have to be like this.

true & 2. If it was then it the general prevalence is even lower.

1 5

Simon Nicholls @sinichol · 7h

How did Pillar1/2 show a prevalence of 0.3% in July, or the ONS survey, which uses PCR, 0.05%?
As you can't sample below the FPR, it is likely 0.05%, at worst 0.3%.
As prevalence drops so does cross contamination, reducing the FPR.
As +ve rate now 2.65%, 2% are FPs, worst 11%.

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @sinichol @PaulJacklin and 2 others

Completely unsafe logic to compare ONS & Pillar 2.
If you were not told it's technically the same assay, you wouldn't guess it.
There is no question that they're doing some or many things differently in ways which hugely affects the FPR.
The detailed protocols are state secrets.

Briefly, pillar 1 is the testing of symptomatic people who present at hospitals or testing centres.
Pillar 2 is the "random" testing of mainly non symptomatic people, via kits to houses, testing vans asking people to test.

4 10 41

Tim Ewen @ewen_tim · 24h
Would people presenting at hospital for say a broken leg and who are routinely tested before admission appear in Pillar 1? Would that skew the figures regardless of outcome of test and if positive count as admission with Covid if positive? Not ill with Covid, broken leg

5 1 3

Grayphil @grayphil27 · 24h
I believe they are pillar one.

1 1 1

Tim Ewen @ewen_tim · 24h
In the figures then but will they be classed as a hospital admission for Covid, ignoring the broken leg?

Assuming that the virus & environment are not greatly different from spring, a possible explanation for the smaller & slower increase in cases &, crucially, deaths might be that the virus is having a harder time finding & infecting a diminishing supply of susceptible people.

The best evidence for whether or not second waves occur comes from the last two, novel coronaviruses. SARS (2003) & MERS (2012). ONE WAVE EACH.
Some claim more than one wave, but careful examination of geography shows one wave occurring each time in different geographies.

Yardley Yeadon @MichaelYeadon3 · 3h
You're absolutely right, that does appear to be the basis of it. Though such evidence as there is from that 102 year ago event suggests at least TWO DIFFERENT VIRUSES. Not multiple waves of one virus. Anyway, that's influenza.

1 11 58

Yardley Yeadon @MichaelYeadon3 · 3h
The best evidence for whether or not second waves occur comes from the last two, novel coronaviruses. SARS (2003) & MERS (2012). ONE WAVE EACH. Some claim more than one wave, but careful examination of geography shows one wave occurring each time in different geographies.

1 10 43

Sniff Snuffkin @djganners · 3h
I remember you saying this to @JuliaHB1 recently and it made so much sense. Not sure why people seem to want to focus on a flu from 102 yrs ago when we have two viruses from the past 20 yrs that provide a much better comparison. 2020's truly gone mad.

The 2nd wave hysteria all originates in decades of crappy analysis of the Spanish Flu which had a 2nd wave much bigger than the first. The true virology and epidemiology of this 2nd wave will never be known. We do know SARS & MERS (recent cov epidemics) had basically no 2nd wave.

with Ct values of 30 & below constitutes too great a risk at this point in time. Yes, those with higher viral loads are likely to be more infectious, but respiratory specimens are not standardised. 22/n

9 4 66

Cillian De Gascun @CillianDeGascun · Sep 13

In addition, testing the same sample on different assays/platforms can give different Ct values reflecting differences in the targets detected & the chemistry of the test used. As such, repeat samples from an infected person should be tested in the same lab each time. 23/n

3 3 36

Cillian De Gascun @CillianDeGascun · Sep 13

Whilst PCR is exquisitely sensitive and remains the current gold-standard for diagnosing #SARSCoV 2 infection, it has some limitations. For example, it does not distinguish between viable virus and non-infectious RNA. 24/n

58 74 145

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @CillianDeGascun

Its incorrect to call PCR the gold standard diagnostic. It's the best we can do in a severely limited world. THE gold standard would be successfully to cultivate virus from the patient sample (by observation the of infection into or damage to cells that viable virus can infect.

aerosols, touch and droplets - and R.

At R=1.25, only 20% of the remaining infectable need to catch it for herd immunity now.

1

Yardley Yeadon @MichaelYeadon3 · 4h

I'm not sure there's quality evidence for those things (besides hand washing). Also, and I'm quite clear on this, true aerosol / respirable deposition is unproven & widely regarded as unlikely / unimportant route of transmission.

I doubt it's as much as 20% to go.

1 1

Yardley Yeadon @MichaelYeadon3 · 4h

My & others calculations indicate 20-25% as the population infected in spring. We saw marked downward forcing on the episode even in the first 3 weeks of strong expansion. I'm optimistic that we're closer to 10% (or less)further to place us under community immunity :)
Strong...

With respect that's a very weak argument. A number of viruses are oncogenic. I'd rather know I'm infected long before symptoms told me something was wrong.

Thats great Andrew but your post is referring to RT PCR tests, it also clearly states the optimum time and optimum way of administering the tests. Neither of which are adhered to and as I said the tests they are lauding are RT PCR, in the UK its just a PCR.

I can quote as good or better studies which show no protection. Recall that WHO agreed they don't work, only changing stance due to political lobbying.
Are you quoting a summary of others studies or a new study?
The former often select poor studies because they are 'useful'.

You can't explain away excess death: so high prevalence, mostly symptomatic, at peak of death = low FPR. Now: opposite so your hypothesis has merit. With PCR testing there will always be a death rate! I can't help you with statistics (very poor) but logic - yes.

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Congobo61465610

Absolutely. I'd be shocked if you thought anyone, not least a biologist, might try to explain away excess deaths (some caused by the virus; some argue 10s of 1000s due to our responses to the virus). So yes, Q solely about the go forward situation.

So... If there was no virus around at all but the average deceased patient had say 2 to 3 tests in the 28 days before death, the data would show some 0.8-1.2% of hospital patients as having died 'with' covid.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @RuminatorDan

If that's correct, and if around half annual deaths were in hospital, say 300,000, then divide by 365 and get 8-ish per day. That seems too high. But maths is my weakest suit, so almost every else will probably be better placed to assess.

I think you're arithmetic is right. Maybe lower because summer if the low season for deaths (but I don't know by how much). Look at the reported deaths data. The flatline over the summer was somewhere in the region of 10 a day on average (+/- several). So...

1

Ruminator Dan @RuminatorDan · 12m

...Can any twitter-friends reading this who are in NHS and/or know the answer say how many tests might be performed on an average patient? I'm sure not a fixed figure, but even a rough number would be useful.

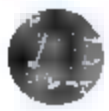
Amy @skepticalzebra · 1h
I'm not a statistician either. But there was a thread on something slightly similar recently. Perhaps @federicolois might be able to help with your question?



> **Federico Andres Lois** @federicolois
> Say you have a completly harmless virus (IFR=0) that can spread at R0=3.3 and you can find via PCR for 19 days. How many deaths per million would you find if you test all deaths in an average european city? cc @LDjaparidze
> Show this thread

1 3

Federico Andres Lois @federicolois · 51m
That is calibrated for 19 days, but that effectively solves your question for whatever epidemic model you want to use.

the proportion of positive tests that will be false, when FPR is proportion of healthy test subjects that will test positive?

> Allow me to explain the impact of a false positive rate of 0.8% on Pillar 2. We return to our 10,000 people who've volunteered to get tested, and the expected ten with virus (0.1% prevalence or 1:1000) have been identified by the PCR test. But now we've to calculate how many false positives are to accompanying them. The shocking answer is 80. 80 is 0.8% of 10,000. That's how many false positives you'd get *every* time you were to use a Pillar 2 test on a group of that size.
>
> The effect of this is, in this example, where 10,000 people have been tested in Pillar 2, could be summarised in a headline like this: "90 new cases were identified today" (10 real positive cases and 80 false positives). But we know this is wildly incorrect. Unknown to the poor technician, there were in this example, only 10 real cases. 80 did not even have a piece of viral RNA in their sample. They are really false positives.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @unimpressdd @Congobo61465610

No, the FPR is the rate of positives in the tested population which are in excess of the (true) positives, that latter dependent on prevalence.

That said, it's interesting to relate the two numbers, just to help with communication. This last bit is just illustrative.

The government is still misrepresenting our virus data.
1. A positive PCR swab test does not mean you have the virus.
2. A hospital admission or death within 28 days of a positive swab does not mean you were admitted/died because of #COVID—19

2/2
The government is significantly overstating the direct #COVID19 related health cost of this virus.
The indirect costs on the other hand, in jobs, mental health, cancer, and much more, are huge.

It's important to show clearly that the Rule of 6 is completely without supporting empirical evidence. No evidence whatsoever that it will work yet the cost & pain is obvious.
Appalling decision making.
Blocking family meeting outside ones household is a Nudge Unit special.

...act fast when needed". I don't think they need do any such thing. But these Powers are ALREADY being used to insert into our lives & against our wills, invasive surveillance software. Absent these War Powers, this could not have been done without parliamentary approval.

44 69 357

Lisa-Marie Stevens @IDontDoLove14 · 4h

Can i ask, if I may, what would happen if we were to all return to normal (pre March)? No masks, no social distancing, shops and restaurants at full capacity? Would we see a greater number of deaths from covid? What evidence really is there to justify implementing such rules?

1 1

Yardley Yeadon

@MichaelYeadon3

They've had no role in the spring event and up to now.
Leading members of SAGE appear to believe serology gives them a good guide to the proportion infected & immune.
I could weep.
If those characters are serious, let's help them rotate the pointer away from 'this way to doom'.

Psyco Bunny @Psycobunny · 7h
I'm worried about your mental health. I've also suffered anxiety during lockdown and fear the coming one but in order to keep arguing the case against we must also look after ourselves.
Find a counsellor or an outlet for your feelings and try to get into an exercise routine.

I'm sure group effects aren't exactly going to encourage dissent at such a size. No coincidence that a lot of organisations who want to get things done, encourage open sharing & questioning & a sense of personal responsibility & accountability, often have smaller teams.

A friend tells me the following is in the Daily Express (ok, I'm desperate):"Lockdown a loser's game, Boris". It says "there's a great, lumbering fact of life that increasing numbers of us have been aware of for months. LOCKDOWN DOESN'T WORK. It simply delays the inevitable".

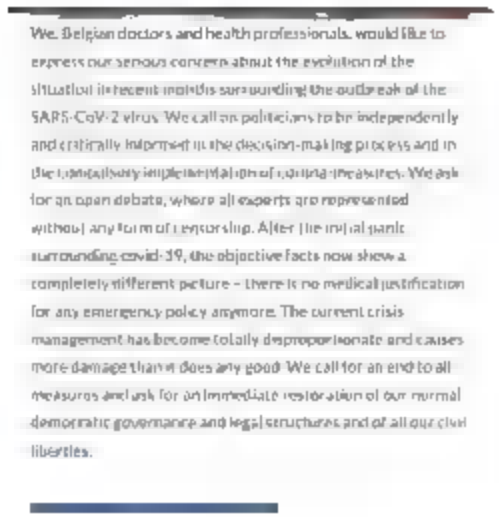
Great to see that nurse speaking out about Covid.



In Belgium a group of over 500 doctors have signed an open letter to the Belgium government & media asking them:

"..for an open debate, where all experts are represented without any form of censorship."

docs4opendebate.be/en/

Open letter from medical doctors and health professionals to all belgian authorities and all belgian media.

We, Belgian doctors and health professionals, would like to express our serious concern about the evolution of the situation in recent months surrounding the outbreak of the SARS-CoV-2 virus. We call on politicians to be independently and critically involved in the decision-making process and in the (un)justifiably implementation of corona-measures. We ask for an open debate, where all experts are represented without any form of censorship. After the initial panic surrounding covid-19, the objective facts now show a completely different picture – there is no medical justification for any emergency policy anymore. The current crisis management has become totally disproportionate and causes more damage than it does any good. We call for an end to all measures and ask for an immediate restoration of our normal democratic governance and legal structures and of all our civil liberties.

Read their stuff. They are saying that masks have virtually no value as did Jennie Harries the deputy Chief Medical Officer. They are all FAR more qualified. The evidence for masks is very poor. That appears to be a medical fact.

1

Ken Haylock @khaylock · 34m
I imagine she'd still say that - WHO says there's no _strong_ evidence yet that cloth or surgical masks will stop you getting COVID19... but _spreading_ COVID19? It's a nailed on slam dunk. If you're an asymptomatic carrier, you're unlikely to know. So mask up to not kill anyone!

You'll have heard the BS from the authorities that all the excess deaths in spring were due to Covid19. Oh no, they weren't.
This excellent piece by the Coroner, working quietly in the background, blows that excuse out of the water. Lockdown killed tens of thousands of people.

Not just random people, Stephen. One of the world's best epidemiologists @SunetraGupta and Oxford professor of Evidence Based Medicine @carlheneghan and Nobel winner @MLevitt_NP2013
All more eminent than Whitty or Vallance.

30 170 796

ClimateKola @JaneDryden4 · Sep 21
I think I'd much rather listen to independent, respected, highly trained scientists than government boffins and random blue ticks on Twitter.

2 3 30

Phil @Pippov66 · Sep 21
The govt boffins are getting independent advice. SAGE consists largely of unpaid academics. You can criticise from various viewpoints but it's not true to suggest govt advice is not "independent".

1 1

ClimateKola @JaneDryden4 · Sep 21
SAGE is staffed by many independent academics but Whitty is employed by the government.

1

Phil @Pippov66 · Sep 21
That's right. Or by the state at least. That's why I said "most" of SAGE. But if Whitty and Valance misrepresented their views they would hardly continue working their arses off for nothing, would they?

If 94% of positives are false positives that makes the government lockdown policy, based on positive tests..look like complete lunacy...They are lying that these are cases anyway. The definition of a case is a person with medical symptoms, from Websters Medical Dictionary.

It's important to point out this only applies to random samples within a population. If you test 100 Covid patients you won't get any false positives whatever the prevalence in society is. The converse also applies for false negatives. Makes me wonder how ONS measures prevalence.

Dr Clare Craig FRCPath @ClareCraigPath · 3h
How can you maximise false positives? Don't take no for an answer. By repeat testing patients who tested negative you can amplify problems with false positive results. There are 7 occasions when we retest people who have tested negative. They are...

3 9 19

Lord Snooty @Lord_Snooty_III · 2h
No one without any symptoms needs testing - asymptomatic spread seems a very remote possibility.

Anyone with symptoms - isolate and then be tested.

1

Dr Clare Craig FRCPath @ClareCraigPath · 2h
Even then we could do with additional tightening of what 'symptomatic' means. If we only tested those with loss of smell in absence of nasal congestion we could still identify every outbreak. Then we could go back and sensitively test the contacts.

1 1

Lord Snooty @Lord_Snooty_III · 2h
Yep and anyone testing positive needs to be promptly re-tested to make sure - and only counted as an actual case if the second test result is also positive.

1 1

Replying to @Lord_Snooty_III @ClareCraigPath

There are people advising the Govt who are very happy if there are lots of positives. False ones will do. It amplifies their influence.

negative. They are...

3 9 19

Liam O'Gradaigh @LGradaigh · 2h

Clare, Director of the National Virus Reference lab in Ireland has back tracked on his earlier tweet quoting FPR of 1-3%. Now says that the positivity of serial testing is only 0.2% and therefore FPR cannot be > 0.2%. The HSE quoting 0.7-0.8%. Our 7 day positivity rate is 2.8%.

1

Dr Clare Craig FRCPath @ClareCraigPath · 2h

There seems to be real confusion about the false positive rate of the test kit (<0.2%) and the false positive rate of the whole testing process which will be higher and can vary depending on other variables.

1 1 3

Liam O'Gradaigh @LGradaigh · 2h

They should just publish the assays they are using. Sensitivity and specificity rates are quoted for all commercial assays.

Replying to @LGradaigh @ClareCraigPath

While that's true, that is not what Clare means. It's incorrect to assume you get in real life what the manufacturer got under the most stringent conditions. Our own Pillars 1, 2 & 4 are notionally identical tests but yield OPERATIONAL (in field) FPRs around 0.4%, 0.8% & 0.05%.

Replying to @AuriaZepherine

I'm concerned that the extraordinarily powerful Coronaviruses Act could be directed to creating a mandate. Of course, medically it's wholly superfluous except for a small vulnerable group.

Radio Row @RadioRow1 · 4 Std.
Antwort an @MichaelYeadon3 @naomi2009 @janekin24
I know what the Ofcom code is though i can't claim to know it in detail.

I'm pretty sure it doesn't disallow critique or criticism of government policy by journalists, so I'm not entirely sure what you're getting at? Objective criticism and impartiality can co-exist.

Richard Drax speaking in the Coronavirus debate in the House. We spoke at length earlier. I told him that in my opinion we were closer to the end than to it's middle.
Unfortunately Mr Drax unaccountably substituted the word “end” for “peak”.
Not happy.
But on we go .

But how do you run all the usual services while dealing with massive numbers of covid patients? Finite number of staff and locations to see and treat patients. Not saying the current situation is ideal but if there's an easy answer then what is it?

13 4

Angela Hay @angelazhay · 7h
There haven't been massive numbers of Covid patients for a while now. Those positive tests called cases mislead. I don't think it helps that GP's are still hiding away. Why aren't they doing the testing? As I keep saying it would solve track and test immediately

1 2 17

jagzdj @jagzdj1 · 7h
Everyone has their opinion but people need to abide by the rules and maintain social distancing! That's the only way we will beat this!

The government needs make the rules clear, is it cases , deaths or hospitalisations esp ICU !

SecondOpinion @DaFeid · 1 Std.

Swine flu 2009 second wave concerns.

NHS vs. WHO
who.int/csr/disease/sw...

nhs.uk/news/heart-and...

300 years, there is little evidence to support the likelihood of a second or third more lethal wave of H1N1 influenza.

- The term "wave" entered into common use after the influenza pandemic that spread from Asia in 1889. Between 1890 and 1894 there were as many as four annual, seasonal peaks in mortality from flu reported after the main pandemic had passed.
- The 1918 influenza pandemic was thought to have killed 50 million people worldwide. However, there is little evidence that the outbreak started with a first wave of milder illness followed by a second, more deadly wave when the virus mutated into a more transmissible and virulent form.

who.int/csr/disease/swineflu,

ulations susceptible to infection
se trends are encouraging, large numbers of pe
remain susceptible to infection. Even if the cur
mild illness continues, the impact of the pande
d wave could worsen as larger numbers of peo
nfected.

mbers of severely ill patients requiring intensiv
e the most urgent burden on health services, cr
: that could overwhelm intensive care units and
e provision of care for other diseases.

No country has lowered anything to do with this virus. It's frankly surprising that people seem to swallow the unconvincing gruel that governments dish out.
I don't believe there's convincing evidence from any country that NPIs have accomplished much of anything at all.

I still disagree. Serious students of the pandemic know there is only one serious candidate for the force which turned a rapidly expanding outbreak into one on steady decline everywhere. And that force isn't human intervention.
That's much more than presentation.

...of nights obs in ICU, are simply not being done, to keep available capacity high.
Of course, what they don't tell you is that a proportion of those waiting such ops just die, and those choosing to leave ICU beds empty in summer knew that.
And did it anyway.

1 6 14

TTB09 @ttb0901 · 2 Std.
My HB in Wales, covering 3 counties, 68 confirmed deaths. Bowel surgery possibly needing ICU support was cancelled 3 times in 15 days - we have an empty ICU bed but you cannot have it. Decided to live with my condition. If it worsens they will have to op as an emergency.

Agree. I don't think that's at all likely & clearly not on that occasion. A danger for all of us from such computations is believing that it's a fixed %. Since it's not inherent, fixed is unlikely rather than the opposite. But whatever it is, it's hopelessly high for screening.

But we're not screening, apart from isolated incidents, the majority of tests require symptoms.

Also, how do days in July produce far less total positives than even 0.8% FPR predicts?

be seen with the COVID virus, are spread then slows , halts and the falls.

This is typical and completely usual for this type of virus.

For HMG to continue wit their lockdown and muzzle policy is..

1 4

MinorMiner @MinorMinerLSE · 15 Std.

..literally fighting yesterday's war while deny real life science, epidemiology, statistics and modelling.

It beggars belief and demands answers as to what SAGE are listening to.

1 1

TheDweeb @thedweebster · 15 Std.

That's nonsense. There's no evidence that this virus has become weaker or less able to spread. The changes in spread are due entirely to the preventative measures that have been taken: distancing, masks, etc. As we relax, so the spread speeds up.

3

Shocking but true: influenza / pneumonia is the cause of death close to 10x more people in Sept than covid19.
I'm hiding behind the sofa until we defeat flu.
And away with "it's different with flu, we've a vaccine".
7 of last 10y, flu vaccine wasn't even 50% effective.

MrAunder @MrAunderBooch
Replying to @MichaelYeadon3

Pfeffel Johnson talks like he's fighting ebola. The ever madder dictator talka of "defeating" the virus, like we've defeated flu with a vaccine presumably, the same flu that is currently killing 10 times as many as c19 is. It is a frightening level of insanity from Bozo.

As Govt fakes more “cases” through inappropriate use of PCR, the lower the calculated infection fatality ratio.
They’re not even complying with their own mandate, to retest positives. I know why they haven’t. It would reveal the extent of their deception as “cases” would crater.

Only 12% of the population have been infected and we have no idea for how long immunity is effective. It may have made some difference, but not much. Even if immunity is 100% effective 88% of the population won't exactly be difficult for the virus to find.

I expect that remaining substrate to be 'consumed', leaving a nation protected by community immunity, preventing outbreaks of even the current size from breaking out. Forget "cases". The PCR data is unreliable. Hospitalisation, ICU occupancy & deaths will show sane patterns.

The NHS has always needed root and branch reform. That's become a mild form of what should happen. Nothing short of dismantling and replacement is good enough now, using one of the large European systems as a model. Get it away from the politicians.

1

Monty3812 @monty3812 · 23 Std.
Their healthcare outcomes are usually much better, they're generally free at point of use. They aren't bloated bureaucracies. It should break up two of the biggest vested interest groups in UK, NHS Doctors and Nurses.

.. of the worlds population dying, or 3 million. I think it's hugely less than this. I doubt Covid19, seen through the actuarial lens of a year, will even make the top ten leading causes of death.
The question is who is amping up this virus (trivial when seen in this context)?

I expect that remaining substrate to be 'consumed', leaving a nation protected by community immunity, preventing outbreaks of even the current size from breaking out. Forget "cases". The PCR data is unreliable. Hospitalisation, ICU occupancy & deaths will show sane patterns.

1 4

anthony sargeant @anthonysargean2 · 52 Min.
Just to thank you for your valiant efforts to alert people to the data and facts.

Incidentally in response your comments about transmission I missed out the word "if" when talking about the uselessness of masks to prevent the claimed aerosol transmission. Apologies, and thanks

Chris Burns @ChrisGBurns · 21 t
So that's 6 false positives out of 770, meaning, 764 actual cases. What was your point again ?

1

Yardley Yeadon
@MichaelYeadon3

Seuraa

Vastauksena käyttäjille @ChrisGBurns, @ILPadrino1994 ja 2 muulle

May I ask how you calculated the six?
You're not Matt Hancock, are you?
He made exactly the same mistake. A 0.8% false positive rate does NOT mean "0.8% of the positives are false".
It's 0,8% of all those tested are false positives. That's a far bigger number than the prevalence.

1.37 - 3. lokak. 2020

1

Chris Burns @ChrisGBurns · 16 t
Vastauksena käyttäjille @MichaelYeadon3, @ILPadrino1994 ja 2 muulle
You said the rate is 0.8%. It should be constant no matter how many you test. 0.8% of 770 is.....6 whole people.

1

Mark Padden @ILPadrino1994 · 16 t
How many students were tested tho? 770 is the positive figure. We don't know how many were actually tested.

...if the overall phenomenon now is the transmission of the virus among the much decreased fraction of the pop which remains susceptible. As soon as you've seen it, you cannot unsee it. Clearly, with the process very much slower, daily deaths will be proportionately fewer.

1 2

Yardley Yeadon @MichaelYeadon3 · 2. Okt.

I expect that remaining substrate to be 'consumed', leaving a nation protected by community immunity, preventing outbreaks of even the current size from breaking out. Forget "cases". The PCR data is unreliable. Hospitalisation, ICU occupancy & deaths will show sane patterns.

Please retweet.

While no one has explicitly stated that children will be included in any imminent, massed vaccination campaign, equally they're not specifically excluded.

I'm in favour of properly developed vaccines.

But it makes no sense to mass vaccinate vs this virus.

There are two other similar managerial jobs being advertised, both mentioning mass vaccination in Wales.

Ones for a 3 month contract, the 12 month contract. So it looks like they might start the vaccinations before January 2021.

It's NOT a "major outbreak".

As no doubt you're all tired of reading, using PCR in mass screening mode on subjects who are mostly asymptomatic, something like 90% of the positives will be false.

Though prevalence is up a bit it's still well below the FPR.

Stop this stupidity

Stop the assumption-based predictive modelling.

Try instead modelling against reality as a tool to test & refine hypotheses as to what's going on.

Then, Imo, you can achieve quite a lot.

Hancock stated that it was “just under 1%”. You can conclude in Pillar 2 that it’s 0.8% as that’s the positivity rate below which threshold signal never went. It cannot ‘hang up’ at real 0.8%. That’s not what biology does. Also, Grant Shapps the next day, speaking about testing..

It's NOT a "major outbreak".

As no doubt you're all tired of reading, using PCR in mass screening mode on subjects who are mostly asymptomatic, something like 90% of the positives will be false.

Though prevalence is up a bit it's still well below the FPR.

Stop this stupidity

No, it's not. In excess of 90% of the students do not have the virus. Of the vanishingly small number who do, a viral culture would be unsuccessful from swabs. Of the tiny number with high viral load, none will be seriously ill.
It's a "huge outbreak" only in a media sense.

The most likely cause of the excess deaths in private houses is inaccessibility of normal medical care.
I say this because on the other side of the ledger, there's a very large & persistent reduction cf prior years of the number of urgent referrals for everything.

This document, in my view, represents the kernel of the most severe assault on the rights of individuals to consent, or not, to what are essentially experimental medical interventions.
I advise everyone read this four page "perspective". How do you feel?

94 515 771

Mark @Mark79641317 · 3. Okt.
I honestly don't think that Covid-19 is a deadly enough disease to warrant a vaccine. If you're fit and healthy why on earth would you take it? It seems to me to be a colossal waste of time, money & effort. It will only be of any use if it prevents the infection of the vulnerable

Diane Pettitt @DiPettitt · 30. Sept.
Problem is that legal advice & court action costs money ....lots of it! Most folk just can't afford to go down that route ...so will just comply - unless there's a way that a massive group action can be organised to fight it in the courts.

Please would you add your voice to a petition that Govt MUST publish the rate of false positives & false negatives?
Mass community PCR testing is used as the main basis for “local lockdowns” so trustworthy data is essential. At present, the data cannot be trusted.

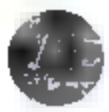
Finally, note that as we learn more about this virus & appreciate how many people have been infected than we ever guessed, there's a benefit: a dawning realisation that it's no more a threat to life than flu.



38 100 458

R.J. Macready #KBF @RobsBottin80 · 2. Okt.
If it didn't have a name, if there were no tests nobody would know it even exists.

My feeling is what we have experienced is a compressed flu season.

1 17

Antwort an @RobsBottin80

Good enough. Of course, it's not actually flu. But we're willing to call almost all upper respiratory tract infections 'colds', despite being caused by myriad different viruses.

Would you not agree that so called Covid-19 is very similar to influenza? I'd like experts to discuss the human virome and explain to people who live in abject fear that our bodies are inhabited by trillions of viruses and some are actually beneficial!

Ralphs bio.

I mean come on. This is just ridiculous.

I don't *want* to target him, but this just needs calling out. If he is what he says he is he'd apologise and retract. But he won't

1 1 24

JS @JonSykesNbr1 · 15 Std.
Instead Ralph will either block me, delete his tweet, flame away or scuttle off to dig up some "dirt" on Michael.

It's a bad year this. A really bad year. And not just because of covid, but because its highlighted that people are no longer able to be civil and/or measured.

30 IS tiny on a population & statistical sense (obv each is a real person & often tragic). But from a public health perspective it's noise. 1650 people die per day in ordinary times. 30 is 2%.
It's not faintly unusual. Respiratory deaths are FAR higher than this, all year round.

I just don't get what their end game is?

4 18

B M @BM7791 · 11 t

End game: immunity passports, legal precedents for coerced vaccination, track and trace as an on ramp for ongoing mass surveillance and economic destruction to necessitate a 'reimagined' economic system to 'build back better' in line with the WEF's 'Great Reset' project.

1 5

Tube Analyst @TubeAnalyst · 9 t

Vastauksena käyttäjille @MichaelYeadon3, @2020Smiles ja @EdConwaySky

It is the trend that is the issue, not the absolute numbers right now - it was only 30 a day in early March but peaked at over 1000 per day. It won't get to that

I'm open to persuasion to change my view on mask wearing however can anyone explain to me why healthcare workers (particularly in hospital environments) wear masks and PPE if they don't work? Until I understand this I'm sticking with mask wearing.

24 2

Yardley Yeadon
@MichaelYeadon3

Antwort an @Plasmadreamer

It may surprise you (it did me) that the RCS proved in the 80s & 90s that masks in surgery do not reduce frequency of wound infections. Surgeons wear masks to prevent blood or other fluids land in their mouths. So they don't work even in the reference setting you cite.

Antwort an @MichaelYeadon3 @DanielJHannan @Fox_Claire
Taking each of your three points in turn, I have some agreements and some disagreements:

I agree they're no panacea, but do you not think that lockdowns can serve some valuable purposes? (e.g. reducing transmission, isolating the sick, quarantining the vulnerable)

1

Lon Won @LonWon · 8 Std.
2. I also agree the students are generally less vulnerable, though some might get ill & a few might die. And the prompt testing and isolation should minimise transmission to the wider community. At the same time... cont'd

Antwort an @ClareCraigPath @leoniedelt @drdickdixon

Yes, I concluded that the authorities are making a huge mistake by pumping up the numbers of (faked) cases. They're driving down the infection fatality ratio to below that of flu. Flu will definitely kill more people between now & March than covid19.

Good for you! Of course, it's illegal under international law to mandate that a person accepts a medical intervention to which they do not consent. It's origins are as an "anti-Mengele las" after the Nazi doctor. Individuals are also prohibited from being coerced into procedures

The 1.6bn is in reference to livelihoods affected by the response to Covid. I can well believe it, but I haven't looked at their research related to this statement.

But admittedly there is a 'may' in there, which of course justifies a lot of bold statements..

I have written to my MP (no reply) to acknowledge that the Nuremberg Code will be used to ensure:
No Mandatory Vaccinations
No Immunity Passports

If CMO and PM came out and said this they would certainly ensure a lot of panic is erased and gain good faith.
But they WON'T.

Those deaths are in the past & most were with or from Covid19.

They are, however, in the part. Current death rates are normal.

There is no public health crisis nor is it plausible that there'll be one.

So - you're saying that

25% mortality over the 10 year average is not a health crisis

Going into respiratory illness season ,("Excess Winter Mortality" season) with a new additional, fatal respiratory disease on the rise is "normal", and not a public health crisis

I disagree

Who cares about your carbon footprint?
What about all the avoidable deaths you've not only allowed to happen, but by keeping the NHS "running light" thro winter, you'll share responsibility for tens of thousands of other innocents?
Shame on you.

There will be physicians, pathologists & others out there who will be far better placed than the rest of us to ask:

Can you think of a good reason for modifying this form in the particular way described, other than to falsify covid19 death numbers?

Belgium & Spain reclassified their "cases" & are using hospitalisations or PCR cycle of 30 & symptoms.

Why is the UK test set at 45 cycles giving 93% False Positives.

People are losing everything based on the results of this test, except for the ones making the rules.

Antwort an @therealvicz @mmjblair und 3 weitere

Do you know if all deaths involving an infectious agent are followed promptly by cremation? If not, why not?

Hundreds of people per day die to of influenza.

The mortality stats, from WHO no less, show that seasonal flu & covid19 are identical at around 0.1%.

That's a fair point. There is also treatment and recovery innovation. However, in The Netherlands, 77.000 healthcare workers got sacked due to budget cuts, this increased the workload over time as well. I'm guessing there are similar patterns all over the EU.

1

Martijn @martijn1k · 48 Min.

This happened 2010/2012. In all fairness, in 2018, the number of open positions in healthcare was 31.000, so it was rising again. But still, that number is less than half of those who lost their jobs in the years before.

Antwort an @MickeyPearce17 @johanscouse

I'm in favour of vaccines. Both I, my wife & our children have had the lot.

My concern isn't to do with any vaccine, here.

It's serious anxiety that someone seems to be building the case either for mandatory or coerced vaccination. There is absolutely no rationale for that.

Being wary of a vaccine that has been rushed through the mandatory safety trials is right.
This so called vaccine they are favouring is not a vaccine.

swprs.org/covid-the-big- …

This chart requires you pay attention. In purple, the 40 million all causes deaths estimated on earth this year to date. In orange, on the same scale, “cases” of Covid19.
The skinny blue line? Covid-19 deaths.
Ready to forever give up your freedoms yet?

Folgen

Antwort an @MickeyPearce17 @johanscouse @LeahButlerSmith

Exactly, and that's coercion, also illegal.

The key point isn't to do with vaccines. It's to do with doing away with informed consent.

After the war, there arose a consensus that never again would humans be forced to accept medical interventions to which they'd not consented.

IFR as low as 0.13% implies an extraordinary number of Britons have had the infection.
UK deaths with a positive test: 42,350
(With C-19 mentioned on the death certificate about 58K)
(42,350 x 1/0.13) x 100 = 32.6M
Can that be right?
If so what happened to HIT of 15-20%?

What criteria would you support for vaccination ?

4 2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @johanscouse

The evidently vulnerable, others can set ages, but perhaps initially 65y+ or anyone carrying the preconditions predicting poor outcomes. Risk / benefit good here.

I'd add anyone who wanted it. I'd advise careful thought, though. If your risks are tiny, why take a new vaccine?

Antwort an @fritleyfrisp81 @RuminatorDan

No, herd immunity means that: it protects the community (or herd). It doesn't mean no one can get an infection, but it DOES mean you cannot get large outbreaks which keep growing.
That's the main reason why spring outbreak terminated everywhere. No lockdown, not masks but HIT.

Yardley Yeadon @MichaelYeadon3 · 15 Std.
Quite. I don't know, either. But they are trying to keep you scared. It's time not to be. No, you don't want to catch this virus, but that's a diminishing likelihood, the time if maximum danger having been Mar/Apr. It won't return. Viruses don't do waves. Look out for 'flu, also.

Genuine Q , if someone has a flu shot say within the last few weeks or months , will it affect the outcome of a covid test , ?

Yardley Yeadon @MichaelYeadon3 · 2 Std.
I doubt it, but Christ only knows.
There is some data of dubious power to generalise which implied potentially greater risks from a second virus if your immunised against another. I'm nowhere near sure enough to advise people to change what they normally do. So if you get 'flu..

Looks like the expense by Govt accomplishes 1 - 1.5% of the population getting tested per week.

Do note that testing people mostly without symptoms yields at least 8000 false positives per million tests. It could be >10,000.

PCR is IRRETRIEVABLY unsuitable for pop screening.

Richard @RP131
I've scraped regional "cumulative people tested" numbers from each of the recent surveillance reports and broken them down weekly. They're not perfect as there seems to be some "jitter" in the numbers but it does give us a rough idea of relative region...

Antwort an @RP131

Richard, why do you think London is unrealistically low? Do you mean too few tests? Or too few cases?
The latter will be correct. London was by far the most intensely infected in spring. This will prevent large scale outbreaks.

Richard @RP131 · 6 Std.

So to make some observations for w/e 20-Sep. NW is testing twice as many people per 1M of population than London and finding 2.6x as many positives per person tested. If people think this is an interesting view of testing numbers then I'll update it tomorrow for the next report.

9 6 59

Chris Drake @chrisdrakeuk · 4 Std.

This week's and next week's reports will be very interesting.

I've been trying to get my head around how to present regional:
tests -> +ve results -> deaths (per 100k)
as a sequence.

2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @chrisdrakeuk @RP131

I suspect you'll find almost no correlation because the testing is incapable of reliably guiding us to genuine outbreaks.

Yardley Yeadon
@MichaelYeadon3

Retired therapeutic drug hunter; loves old motorcycles; lives with chronic pain. Still lucky in love after 38y.

Rural east Kent
Beigetreten Oktober 2018

You may have read the rather moderate requests made in the 'Great Barrington Declaration', drafted by three top quality scientists of whom one is Oxford's Prof Sunetra Gupta. That document has been savaged by several people who's so-called rebuttals can be found at this link:

1 2 1

Yardley Yeadon
@MichaelYeadon3

Folgen

sciencemediacentre.org/expert-reactio
...

Encouragingly, a Fiona Fox argues we should hear directly from scientists. Odd, then, that the rebuttal above has no mechanism to respond to it.
sciencemediacentre.org/covid-19-why-w ...
Fiona Fox's blog, helpfully, does have a comment forum below her piece. So I decided..

...as akin to seasonal influenza, killing around 1 in 1000 people it infects. In matters affecting the whole population, it's important to be dispassionate. The general public doesn't routinely need to know that every year, just under 1% of us won't make our next birthday.

Viewed against that, which represents around 620,000 deaths annually, the approximately 0.06% who have died from or with covid19 is, as you can see, from an actuarial perspective, not even a leading cause of death.
So here we are, engaged in a battle to prevent the spread of a..
